

Story-first: question → experiment → result → limitation

Best for a mixed audience that needs the research arc before the detailed plots.

1 Six-sentence TL;DR

State what was implemented, the finite-parameter QFT question, what the certificate predicted, what held-out experiments found, the QFT-only resource change, and the exact scope limit.

2 Beginner entry point

Use first: establish the Shor/Regev distinction.

3 What the code does

A compact map from samples to factor extraction.

4 Primary result

Largest panel: the held-out certificate-versus-recovery comparison.

5 Uncertainty across N

Support the result with whole-modulus uncertainty.

6 Why the certificate is conservative

Mechanism and tested parameter range.

7 Resource accounting

Label all savings as QFT-only.

8 Claim boundary

Finish with what the result does and does not show.

9 Methods strip

Frozen held-out semiprimes, roots, sample models, seeds, non-inferiority rule, whole-N bootstrap, and exclusions. Keep this readable but visually subordinate to the result.
